

Operations Incident Review Volume 6

Post-mortem 1: INC-60800

Incident INC-60800 occurred on 5 June 2021 at the Quito data center and lasted 339 minutes. Severity was rated SEV-3. The incident commander was Hannah Cole, supported by the Research team.

Root cause: a misconfigured certificate caused 78% of requests to fail. 52622 customers were affected. The first alert fired 35 minutes after the change was deployed (change ticket CHG-2174).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Sara Haddad will add automated validation by 16 November 2019; Lena Fischer will update the runbook; estimated cost of the outage was \$628,000.

Lessons learned: alert thresholds were set to 6 minutes, which was too slow. We now require a canary phase of 54 minutes before global rollout.

Post-mortem 2: INC-40822

Incident INC-40822 occurred on 12 June 2024 at the Bergen data center and lasted 6 minutes. Severity was rated SEV-4. The incident commander was Marcus Webb, supported by the Research team.

Root cause: a misconfigured DNS record caused 19% of requests to fail. 66529 customers were affected. The first alert fired 13 minutes after the change was deployed (change ticket CHG-1724).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Lena Fischer will add automated validation by 10 July 2020; Sara Haddad will update the runbook; estimated cost of the outage was \$398,000.

Lessons learned: alert thresholds were set to 21 minutes, which was too slow. We now require a canary phase of 16 minutes before global rollout.

Post-mortem 3: INC-65798

Incident INC-65798 occurred on 5 May 2023 at the Quito data center and lasted 497 minutes. Severity was rated SEV-1. The incident commander was Tomas Novak, supported by the Security team.

Root cause: a misconfigured DNS record caused 22% of requests to fail. 53194 customers were affected. The first alert fired 44 minutes after the change was deployed (change ticket CHG-9476).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Marcus Webb will add automated validation by 15 February 2024; Hannah Cole will update the runbook; estimated cost of the outage was \$755,000.

Lessons learned: alert thresholds were set to 4 minutes, which was too slow. We now require a canary phase of 46 minutes before global rollout.

Post-mortem 4: INC-63015

Incident INC-63015 occurred on 26 January 2021 at the Hamburg data center and lasted 136 minutes. Severity was rated SEV-4. The incident commander was Hannah Cole, supported by the Security team.

Root cause: a misconfigured load balancer caused 64% of requests to fail. 86697 customers were affected. The first alert fired 43 minutes after the change was deployed (change ticket CHG-7581).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Diego Alvarez will add automated validation by 25 January 2023; Diego Alvarez will update the runbook; estimated cost of the outage was \$269,000.

Lessons learned: alert thresholds were set to 24 minutes, which was too slow. We now require a canary phase of 45 minutes before global rollout.

Post-mortem 5: INC-25198

Incident INC-25198 occurred on 20 August 2024 at the Perth data center and lasted 348 minutes. Severity was rated SEV-3. The incident commander was Marcus Webb, supported by the Quality team.

Root cause: a misconfigured DNS record caused 56% of requests to fail. 70692 customers were affected. The first alert fired 25 minutes after the change was deployed (change ticket CHG-2310).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Priya Nair will add automated validation by 1 June 2023; Lena Fischer will update the runbook; estimated cost of the outage was \$532,000.

Lessons learned: alert thresholds were set to 27 minutes, which was too slow. We now require a canary phase of 44 minutes before global rollout.

Post-mortem 6: INC-69636

Incident INC-69636 occurred on 14 January 2026 at the Nairobi data center and lasted 45 minutes. Severity was rated SEV-1. The incident commander was Ingrid Solberg, supported by the Security team.

Root cause: a misconfigured cache cluster caused 8% of requests to fail. 79555 customers were affected. The first alert fired 44 minutes after the change was deployed (change ticket CHG-7050).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Tomas Novak will add automated validation by 14 June 2023; Aiko Tanaka will update the runbook; estimated cost of the outage was \$560,000.

Lessons learned: alert thresholds were set to 9 minutes, which was too slow. We now require a canary phase of 16 minutes before global rollout.

Post-mortem 7: INC-48435

Incident INC-48435 occurred on 12 July 2019 at the Perth data center and lasted 337 minutes. Severity was rated SEV-3. The incident commander was Hannah Cole, supported by the Platform team.

Root cause: a misconfigured queue consumer caused 16% of requests to fail. 47824 customers were affected. The first alert fired 3 minutes after the change was deployed (change ticket CHG-9704).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Rafael Costa will add automated validation by 13 April 2021; Marcus Webb will update the runbook; estimated cost of the outage was \$552,000.

Lessons learned: alert thresholds were set to 4 minutes, which was too slow. We now require a canary phase of 13 minutes before global rollout.

Post-mortem 8: INC-28958

Incident INC-28958 occurred on 21 August 2025 at the Nairobi data center and lasted 358 minutes. Severity was rated SEV-4. The incident commander was Rafael Costa, supported by the Logistics team.

Root cause: a misconfigured DNS record caused 95% of requests to fail. 69623 customers were affected. The first alert fired 37 minutes after the change was deployed (change ticket CHG-8510).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Aiko Tanaka will add automated validation by 3 June 2024; Aiko Tanaka will update the runbook; estimated cost of the outage was \$155,000.

Lessons learned: alert thresholds were set to 20 minutes, which was too slow. We now require a canary phase of 51 minutes before global rollout.

Post-mortem 9: INC-93599

Incident INC-93599 occurred on 26 February 2025 at the Bergen data center and lasted 85 minutes. Severity was rated SEV-3. The incident commander was Hannah Cole, supported by the Research team.

Root cause: a misconfigured cache cluster caused 56% of requests to fail. 53525 customers were affected. The first alert fired 2 minutes after the change was deployed (change ticket CHG-4013).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Rafael Costa will add automated validation by 9 December 2020; Diego Alvarez will update the runbook; estimated cost of the outage was \$124,000.

Lessons learned: alert thresholds were set to 26 minutes, which was too slow. We now require a canary phase of 17 minutes before global rollout.

Post-mortem 10: INC-84828

Incident INC-84828 occurred on 9 May 2022 at the Lisbon data center and lasted 388 minutes. Severity was rated SEV-4. The incident commander was Lena Fischer, supported by the Quality team.

Root cause: a misconfigured certificate caused 37% of requests to fail. 25341 customers were affected. The first alert fired 18 minutes after the change was deployed (change ticket CHG-9217).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Hannah Cole will add automated validation by 2 October 2025; Priya Nair will update the runbook; estimated cost of the outage was \$699,000.

Lessons learned: alert thresholds were set to 10 minutes, which was too slow. We now require a canary phase of 22 minutes before global rollout.

Post-mortem 11: INC-10662

Incident INC-10662 occurred on 14 April 2019 at the Quito data center and lasted 137 minutes. Severity was rated SEV-3. The incident commander was Tomas Novak, supported by the Security team.

Root cause: a misconfigured queue consumer caused 83% of requests to fail. 42701 customers were affected. The first alert fired 7 minutes after the change was deployed (change ticket CHG-4626).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Lena Fischer will add automated validation by 1 December 2024; Lena Fischer will update the runbook; estimated cost of the outage was \$70,000.

Lessons learned: alert thresholds were set to 20 minutes, which was too slow. We now require a canary phase of 23 minutes before global rollout.

Post-mortem 12: INC-89864

Incident INC-89864 occurred on 27 August 2025 at the Pune data center and lasted 341 minutes. Severity was rated SEV-4. The incident commander was Ingrid Solberg, supported by the Logistics team.

Root cause: a misconfigured load balancer caused 45% of requests to fail. 45642 customers were affected. The first alert fired 21 minutes after the change was deployed (change ticket CHG-6674).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Ingrid Solberg will add automated validation by 5 August 2026; Lena Fischer will update the runbook; estimated cost of the outage was \$550,000.

Lessons learned: alert thresholds were set to 23 minutes, which was too slow. We now require a canary phase of 15 minutes before global rollout.

Post-mortem 13: INC-98209

Incident INC-98209 occurred on 13 May 2025 at the Lisbon data center and lasted 590 minutes. Severity was rated SEV-1. The incident commander was Hannah Cole, supported by the Security team.

Root cause: a misconfigured queue consumer caused 46% of requests to fail. 11891 customers were affected. The first alert fired 14 minutes after the change was deployed (change ticket CHG-9676).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Sara Haddad will add automated validation by 10 May 2024; Ingrid Solberg will update the runbook; estimated cost of the outage was \$695,000.

Lessons learned: alert thresholds were set to 15 minutes, which was too slow. We now require a canary phase of 6 minutes before global rollout.

Post-mortem 14: INC-30434

Incident INC-30434 occurred on 20 October 2021 at the Pune data center and lasted 365 minutes. Severity was rated SEV-4. The incident commander was Diego Alvarez, supported by the Quality team.

Root cause: a misconfigured load balancer caused 98% of requests to fail. 38209 customers were affected. The first alert fired 36 minutes after the change was deployed (change ticket CHG-9040).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Lena Fischer will add automated validation by 13 September 2021; Diego Alvarez will update the runbook; estimated cost of the outage was \$626,000.

Lessons learned: alert thresholds were set to 28 minutes, which was too slow. We now require a canary phase of 12 minutes before global rollout.

Post-mortem 15: INC-22711

Incident INC-22711 occurred on 13 April 2022 at the Osaka data center and lasted 589 minutes. Severity was rated SEV-3. The incident commander was Priya Nair, supported by the Quality team.

Root cause: a misconfigured DNS record caused 96% of requests to fail. 53575 customers were affected. The first alert fired 36 minutes after the change was deployed (change ticket CHG-7693).

Remediation: the change was rolled back and the service recovered fully. Follow-up actions: Sara Haddad will add automated validation by 25 April 2025; Yuki Mori will update the runbook; estimated cost of the outage was \$290,000.

Lessons learned: alert thresholds were set to 11 minutes, which was too slow. We now require a canary phase of 54 minutes before global rollout.
